Introduction to Spark

Louis Jachiet

Louis JACHIET 1 / 66

Spark Motivation

Apache Spark

IBM and Apache Spark

Louis JACHIET 2 / 66

What is Apache Spark

Apache Spark is a fast and general engine for large-scale data processing.

- **Speed**: Run programs up to 100x faster than Hadoop MapReduce in memory, or 10x faster on disk.
- Ease of Use: Write applications quickly in Java, Scala, Python, R.
- Generality: Combine SQL, streaming, and complex analytics.
- Runs Everywhere: Spark runs on Hadoop, Mesos, standalone, or in the cloud.

Louis JACHIET 3 / 66

Spark Ecosystem

Spark Spark Streaming MLlib (machine learning) GraphX (graph)

Apache Spark

Louis JACHIET 4 / 66

```
text_file = spark.textFile("hdfs://...")

text_file.flatMap(lambda line: line.split())
    .map(lambda word: (word, 1))
    .reduceByKey(lambda a, b: a+
```

Word count in Spark's Python API

Louis JACHIET 5 / 66

Word count in Spark's Scala API

Louis JACHIET 6 / 66

Apache Spark

Apache Spark Project

- Spark started as a research project at UC Berkeley
 - Matei Zaharia created Spark during his PhD
 - Ion Stoica was his advisor
- DataBricks is the Spark start-up, that has raised \$46 million

⇒ Now an Apache project

Louis JACHIET 7 / 66

Resilient Distributed Datasets (RDDs)

- An RDD is a fault-tolerant collection of elements that can be operated on in parallel.
- RDDs are created :
 - · parallelizing an existing collection in your driver program, or

referencing a dataset in an external storage system

Louis JACHIET 8 / 66

Spark API: Parallel Collections

data = [1, 2, 3, 4, 5]
distData = sc.parallelize(data)

Spark's Python API

Louis JACHIET 9 / 66

Spark API: Parallel Collections

val data = Array(1, 2, 3, 4, 5)
val distData = sc.parallelize(data)

Spark's Scala API

Louis JACHIET 10 / 66

Spark API: Parallel Collections

```
List<Integer> data = Arrays.asList(1, 2, 3, 4, 5);
JavaRDD<Integer> distData = sc.parallelize(data);
Spark's Java API
```

Louis JACHIET 11 / 66

Spark API: External Datasets

```
>>> distFile = sc.textFile("data.txt")
PythonRDD[60] at RDD at PythonRDD.scala:53
```

Spark's Python API

Louis JACHIET 12 / 66

Spark API: External Datasets

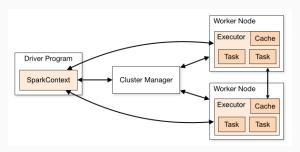

Louis JACHIET 13 / 66

Spark API: External Datasets

Louis JACHIET 14 / 66

Spark Cluster

Cluster Components

Louis JACHIET 15 / 66

Spark Cluster

- Spark is agnostic to the underlying cluster manager.
- The spark driver is the program that declares the transformations and actions on RDDs of data and submits such requests to the master.
- Each application gets its own executor processes, which stay
 up for the duration of the whole application and run tasks in
 multiple threads. Each driver schedules its own tasks.
- The drivers must listen for and accept incoming connections from its executors throughout its lifetime
- Because the driver schedules tasks on the cluster, it should be

Louis JACHIET 16 / 66

Apache Spark Streaming

Spark Streaming is an extension of Spark that allows processing data stream using micro-batches of data.

Louis JACHIET 17 / 66

Discretized Streams (DStreams)

- Discretized Stream or DStream represents a continuous stream of data,
 - either the input data stream received from source, or
 - the processed data stream generated by transforming the input stream
- Internally, a DStream is represented by a continuous series of RDDs

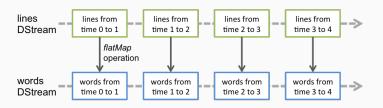

Louis JACHIET 18 / 66

Discretized Streams (DStreams)

 Any operation applied on a DStream translates to operations on the underlying RDDs.

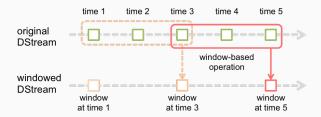

Louis JACHIET 18 / 66

Discretized Streams (DStreams)

• Spark Streaming provides windowed computations, which allow transformations over a sliding window of data.

Louis JACHIET 18 / 66

Spark Streaming

```
val conf = new SparkConf().setMaster("local[2]").setAppName("WCount")
val ssc = new StreamingContext(conf, Seconds(1))
// Create a DStream that will connect to hostname:port, like localhost:9999
val lines = ssc.socketTextStream("localhost", 9999)
// Split each line into words
val words = lines.flatMap( .split(" "))
// Count each word in each batch
val pairs = words.map(word => (word, 1))
val wordCounts = pairs.reduceByKey(_ + _)
// Print the first ten elements of each RDD generated in this DStream to the console
wordCounts.print()
ssc.start()
                 // Start the computation
ssc.awaitTermination() // Wait for the computation to terminate
```

Louis JACHIET 19 / 66

Spark SQL and DataFrames

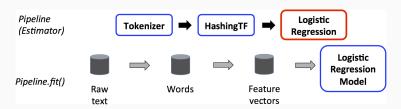

- Spark SQL is a Spark module for structured data processing.
- It provides a programming abstraction called DataFrames and can also act as distributed SQL query engine.
- A DataFrame is a distributed collection of data organized into named columns. It is conceptually equivalent to a table in a relational database.

Louis JACHIET 20 / 66

Spark Machine Learning Libraries

- MLLib contains the original API built on top of RDDs.
- spark.ml provides higher-level API built on top of DataFrames for constructing ML pipelines.

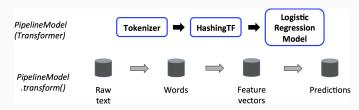

Louis JACHIET 21 / 66

Spark Machine Learning Libraries

- MLLib contains the original API built on top of RDDs.
- spark.ml provides higher-level API built on top of DataFrames for constructing ML pipelines.

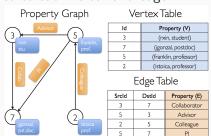

Louis JACHIET 21 / 66

Spark GraphX

- GraphX optimizes the representation of vertex and edge types when they are primitive data types
- The property graph is a directed multigraph with user defined objects attached to each vertex and edge.

Louis JACHIET 22 / 66

Spark GraphX

```
// Assume the SparkContext has already been constructed
val sc: SparkContext
// Create an RDD for the vertices
val users: RDD[(VertexId, (String, String))] =
 sc.parallelize(Array((3L, ("rxin", "student")), (7L, ("jgonzal", "postdoc")),
                       (5L, ("franklin", "prof")), (2L, ("istoica", "prof"))))
// Create an RDD for edges
val relationships: RDD[Edge[String]] =
 sc.parallelize(Array(Edge(3L, 7L, "collab"), Edge(5L, 3L, "advisor"),
                       Edge(2L, 5L, "colleague"), Edge(5L, 7L, "pi")))
// Define a default user in case there are relationship with missing user
val defaultUser = ("John Doe", "Missing")
// Build the initial Graph
val graph = Graph(users, relationships, defaultUser)
```

Louis JACHIET 23 / 66

Apache Spark Summary

Apache Spark is a fast and general engine for large-scale data processing.

- **Speed**: Run programs up to 100x faster than Hadoop MapReduce in memory, or 10x faster on disk.
- Ease of Use: Write applications quickly in Java, Scala, Python, R.
- Generality: Combine SQL, streaming, and complex analytics.
- Runs Everywhere: Spark runs on Hadoop, Mesos, standalone, or in the cloud.

Louis JACHIET 24 / 66

Spark Resilient Distributed Datasets

Resilient Distributed Datasets (RDD)

Key ideas for Spark

1. Keep a trace of how data was constructed

Louis JACHIET 25 / 66

Resilient Distributed Datasets (RDD)

Key ideas for Spark

- 1. Keep a trace of how data was constructed
- 2. Computation failure is rare

Louis JACHIET 25 / 66

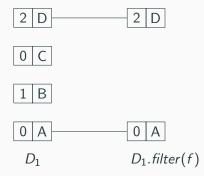

Resilient Distributed Datasets (RDD)

Key ideas for Spark

- 1. Keep a trace of how data was constructed
- 2. Computation failure is rare
- 3. Provide high(er)-level constructs and interactivity

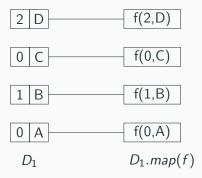

Louis JACHIET 25 / 66

Simple operations on RDD

Simple operations on RDD

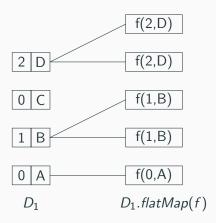

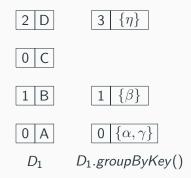

Louis JACHIET 26 / 66

2 D	3 η
0 C	$\boxed{0 \mid \gamma}$
1 B	$oxed{1 eta}$
0 A	0 α
D_1	D_2

2 D	3	η
0 C	0	γ
1 B	1	β
0 A	0	α
D_1	E)2
D_1 .union(D_2)

2 D	3 η	$1 \mid B \mid \beta$
0 C	$\boxed{0 \mid \gamma}$	0 C α
1 B	$oxed{1}eta$	$\boxed{1 \mid A \mid \gamma}$
0 A	0α	0 A α
D_1	D_2	0 C γ
		D_1 .join (D_2)

2 D	3 η	2 { <i>D</i> },∅
0 C	0 7	$\emptyset, \{\eta\}$
1 B	$oxed{1}eta$	1 $\{B\}, \{\beta\}$
0 A	0 α	$0 \{A, C\}, \gamma\}$
D_1	D_2	$D_1.coGroup2(D_2)$

Practical Spark

filter	limits the number of records	
map	transform records	
mapValues	transforms only the value	
flatMap	maps each record to 0, 1 or more elements	
reduce	combines all elements	
fold	combines all elements with an initial value	
aggregate	fold+reduce	
distinct	eliminates duplicates	

Manipulating RDDs

```
groupByKey corresponds to a shuffle reduceByKey(f) reduce for each key foldByKey(f) fold for each key keyBy(f) create pair-RDD from RDD
```

Manipulating pair-RDDs

	build the cartesian product
join	behaves like SQL join (supposes two pair-RDDs)
union	takes the union of two RDDs
intersection	takes the union of two RDDs
substract	takes the union of two RDDs
coGroup	generalized groupByKey (supposes two pair-RDDs)

Combining several RDDs

textFile(path)

creates an RDD with an item per line saveAsTextFile(path) | saves an RDD with an item per line sortWith(f) | sort according to comparison f

Tools for RDDs

take(n)retrieves the *n* first elements collect() | retrieves whole RDD count() | counts the number of items fold / reduce / aggregate foreach apply a function on each element

Actions on RDDs

Louis JACHIET 30 / 66

Spark API: RDD Operations

```
lines = sc.textFile("data.txt")
lineLengths = lines.map(lambda s: len(s))
totalLength = lineLengths.reduce(lambda a, b: a + b)
```

Spark's Python API

Louis JACHIET 31 / 66

Spark API: RDD Operations

```
val lines = sc.textFile("data.txt")
val lineLengths = lines.map(s => s.length)
val totalLength = lineLengths.reduce((a, b) => a + b)
```

Spark's Scala API

Spark API: RDD Operations

```
JavaRDD<String> lines = sc.textFile("data.txt");
JavaRDD<Integer> lineLengths = lines.map(s -> s.length());
int totalLength = lineLengths.reduce((a, b) -> a + b);
```

Spark's Java API

Louis JACHIET 33 / 66

Spark API: Working with Key-Value Pairs

```
lines = sc.textFile("data.txt")
pairs = lines.map(lambda s: (s, 17)
counts = pairs.reduceByKey(lambda a, b: a + b)
```

Spark's Python API

Louis JACHIET 34 / 66

Spark API: Working with Key-Value Pairs

```
val lines = sc.textFile("data.txt")
val pairs = lines.map(s => (s, 1))
val counts = pairs.reduceByKey((a, b) => a + b)
```

Spark's Scala API

Louis JACHIET 35 / 66

Spark API: Working with Key-Value Pairs

```
JavaRDD<String> lines = sc.textFile("data.txt");
JavaPairRDD<String, Integer> pairs =
    lines.mapToPair(s -> new Tuple2(s, 1));
JavaPairRDD<String, Integer> counts =
    pairs.reduceByKey((a, b) -> a + b);
```

Spark's Java API

Exercise revisited (easy)

Input

You are given a list of pairs (k_i, v_i) where k_i is a string and v_i an integer.

Problem

Compute the average value for each key.

Example

INPUT	
Α	42
В	17
Α	12
В	99

	OUTPUT
А	$\frac{42+12}{2} = 27$
В	$\frac{17 + 99}{2} = 58$

Louis JACHIET 37 / 66

Exercise revisited (medium)

Input

You are given two lists of items.

Problem

Compute the list of item appearing in the first one but not in the second.

Example

INPUT 1	
А	
В	
C	

INPUT2
А
C
Ε

OUTPUT B

Louis JACHIET 38 / 66

Exercise revisited (hard)

Input

You are given the Twitter following list: each record is a pair (A_i, B_i) indicating that account A_i follows B_i .

Problem

Compute the accounts that have more followers than followees.

Example

INPUT	
A	В
Α	D
В	C
В	D
C	Е

OUTPUT	
Е	
D	
С	

Louis JACHIET 39 / 66

Exercise revisited (hardest)

Input

You are given the Twitter following list: each record is a pair (A_i, L_i) indicating that account A_i follows the accounts in the list L_i .

Problem

Compute for each account A the list of accounts that are followed by an account followed by A.

Example

Louis JACHIET 40 / 66

Iterations

Iteration

Spark is especially competitive for jobs requiring long chain of individual jobs.

Louis JACHIET 41 / 66

Iteration

Spark is especially competitive for jobs requiring long chain of individual jobs.

Such jobs are often required by data mining algorithm (e.g. the gradient descent for logistic regression).

Louis JACHIET 41 / 66

Logistic regression

```
# Compute logistic regression gradient for a matrix of data points
def gradient(matrix, w):
   Y = matrix[:, 0] # point labels (first column of input file)
    X = matrix[:, 1:] # point coordinates
    # For each point (x, y), compute gradient function, then sum these up
    return ((1.0 / (1.0 + np.exp(-Y * X.dot(w))) - 1.0) * Y * X.T).sum(1)
def add(x, y):
    x += v
    return x
for i in range(iterations):
    print("On iteration %i" % (i + 1))
     w -= points.map(lambda m: gradient(m, w)).reduce(add)
```

From Spark: examples/src/main/python/logistic_regression.py

Caching and persistence

Context

RDD materialization are only triggered by an action.

Louis JACHIET 43 / 66

Context

RDD materialization are only triggered by an action.

Spark caches by default the materialization, but the user can specify the caching.

Louis JACHIET 43 / 66

Caching

Туре	Space	CPU
MEMORY_ONLY*	high	low
MEMORY_ONLY_SER	low	high
MEMORY_AND_DISK	high	med
MEMORY_AND_DISK_SER	low	high
DISK_ONLY	low	high

Louis JACHIET 44 / 6

Logistic regression

```
# Compute logistic regression gradient for a matrix of data points
def gradient(matrix, w):
   Y = matrix[:, 0] # point labels (first column of input file)
    X = matrix[:, 1:] # point coordinates
    # For each point (x, y), compute gradient function, then sum these up
    return ((1.0 / (1.0 + np.exp(-Y * X.dot(w))) - 1.0) * Y * X.T).sum(1)
def add(x, y):
    x += v
    return x
for i in range(iterations):
    print("On iteration %i" % (i + 1))
     w -= points.map(lambda m: gradient(m, w)).reduce(add)
```

From Spark: examples/src/main/python/logistic_regression.py

Louis JACHIET 45 / 66

Shared Variables

Spark API: Shared Variables

```
>>> broadcastVar = sc.broadcast([1, 2, 3])
```

>>> broadcastVar.value

[1, 2, 3]

Spark's Python API

Spark API: Shared Variables

Spark API: Shared Variables

Louis JACHIET 48 / 66

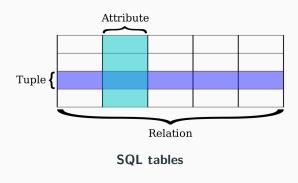

Spark Dataframes

SQL model

Louis JACHIET 49 / 66

SQL model

Dataframes are basically RDD with an explicit schema but:

- 1. untyped data
- 2. can be optimized

Louis JACHIET 49 / 66

Creating Dataframes From RDDs 1/3

```
val movies = ... // of type RDD[(int,string,string)]
...
val dfMovies = movies.toDF("movieId","title","genre")
```

Louis JACHIET 50 / 66

Creating Dataframes From RDDs 2/3

```
class Movie(movieId: Int, title: String,genre: String)
...
val movies = ... // of type RDD[Movie]
...
val dfMovies = movies.toDF
```

Louis JACHIET 51 / 66

Creating Dataframes From RDDs 3/3

Louis JACHIET 52 / 66

Creating Dataframes From Files

Spark can read from:

- 1. CSV
- 2. JSON
- 3. Parquet
- 4. etc.

Louis JACHIET 53 / 66

Creating Dataframes From Files

Spark can read from:

- 1. CSV
- 2. JSON
- 3. Parquet
- 4. etc.

Louis JACHIET 54 / 66

Operations on DataFrames

select	select projection on some columns	
agg	aggregation	
groupBy	use in conjunction with agg	
join	inner join	
filter	filter some columns	
limit	equivalent to take(n)	
orderBy	sort by a given column	
where	condition on join	
union	union	
show	print 20 first entries	
rintSchema	print schema	
as	name table	
drop	remove records with NULL	
fill	replace NULL with value	

Louis JACHIET 55 / 66

Example

Louis JACHIET 56 / 66

Exercise revisited (easy)

Input

You are given a list of pairs (k_i, v_i) where k_i is a string and v_i an integer.

Problem

Compute the average value for each key.

Example

INPUT	
Α	42
В	17
Α	12
В	99

	OUTPUT
А	$\frac{42+12}{2} = 27$
В	$\frac{17 + 99}{2} = 58$

Louis JACHIET 57 / 66

Exercise revisited (medium)

Input

You are given two lists of items.

Problem

Compute the list of item appearing in the first one but not in the second.

Example

INPUT 1	
Α	
В	
C	

INPUT2
А
C
Ε

OUTPUT B

Louis JACHIET 58 / 66

Exercise revisited (hard)

Input

You are given the Twitter following list: each record is a pair (A_i, B_i) indicating that account A_i follows B_i .

Problem

Compute the accounts that have more followers than followees.

Example

INPUT	
A	В
Α	D
В	C
В	D
C	Е

OUTPUT
Е
D
С

Louis JACHIET 59 / 66

Exercise revisited (hardest)

Input

You are given the Twitter following list: each record is a pair (A_i, L_i) indicating that account A_i follows the accounts in the list L_i .

Problem

Compute for each account A the list of accounts that are followed by an account followed by A.

Example

Louis JACHIET 60 / 66

Datasets

Datasets

Dataframes can be generalized into *Datasets*, giving the best of both worlds.

both worlds.

Louis JACHIET 61 / 66

Spark SQL

Use any SQL command

Example!

Louis JACHIET 62 / 66

Exercise revisited (easy)

Input

You are given a list of pairs (k_i, v_i) where k_i is a string and v_i an integer.

Problem

Compute the average value for each key.

Example

INPUT	
Α	42
В	17
Α	12
В	99

	OUTPUT
А	$\frac{42+12}{2} = 27$
В	$\frac{17 + 99}{2} = 58$
